

# B.M.S. College of Engineering, Bengaluru-560019

Autonomous Institute Affiliated to VTU

## January / February 2025 Semester End Main Examinations

**Programme: B.E.**

**Semester: III**

**Branch: Biotechnology**

**Duration: 3 hrs.**

**Course Code: 23BT3ESPPC / 22BT3PCPPC**

**Max Marks: 100**

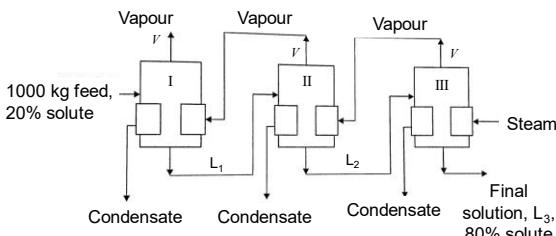

**Course: Process Principles and Calculations**

**Instructions:** 1. Answer any FIVE full questions, choosing one full question from each unit.  
 2. Missing data, if any, may be suitably assumed.  
 3. Use of psychrometric (humidity) chart and periodic table is allowed.

UNIT - I			CO	PO	Marks
1	a)	A gas mixture has a composition of 50% methane, 20% nitrogen, 10% oxygen, 10% carbon dioxide, and 10% sulfur dioxide, on a weight basis. Express the composition of the mixture on a mole basis.	CO1	PO1	<b>10</b>
	b)	A lab technician in the lab wants to prepare 500 mL of the following NaOH concentration solutions. i. 10 Normal ii. 10 Molar iii. 10 Molal iv. 10% by weight Assuming the solution density is equal to 1000 kg/m <sup>3</sup> , calculate the quantity of NaOH to be added in grams to prepare the above solutions.	CO1	PO1	<b>10</b>
<b>OR</b>					
2	a)	What is the relationship between pH and pKa? Explain.	CO1	PO1	<b>06</b>
	b)	Discuss with equations to determine the mole percentage from a given weight of two components A and B.	CO1	PO1	<b>04</b>
	c)	A sample of caustic soda flakes contains 74.6% Na <sub>2</sub> O by weight. Determine the purity of flakes.	CO1	PO1	<b>04</b>
	d)	An aqueous solution of sodium chloride is prepared by dissolving 25 kg of sodium chloride in 100 kg of water. Determine i. weight % ii. mole % composition of solution	CO1	PO1	<b>06</b>

**Important Note:** Completing your answers, compulsorily draw diagonal cross lines on the remaining blank pages. Revealing of identification, appeal to evaluator will be treated as malpractice.

<b>UNIT - II</b>					
3	a)	<p>By electrolyzing a mixed brine, a gaseous mixture is obtained at the cathode having the following composition by weight: <math>\text{Cl}_2 = 67\%</math>, <math>\text{Br}_2 = 28\%</math> and <math>\text{O}_2 = 5\%</math>. Calculate the following.</p> <p>(i) Composition of gas by volume  (ii) Average molecular weight and  (iii) Density of gas mixture at 298 K and 101.325 kPa.</p> <p>Data: Atomic weights: Cl = 35.5, Br = 80 and O = 16</p>	<i>CO1</i>	<i>PO1</i>	<b>10</b>
	b)	<p>An air (B) – water vapor (A) sample has a dry bulb temperature 55°C and absolute humidity 0.030 <math>\frac{\text{kg of water vapour}}{\text{kg dry air}}</math> at 1 standard atmospheric pressure. Tabulate its characteristics:</p> <p>a) Molal absolute humidity  b) Partial pressure of water vapor  c) Dewpoint  d) Humid volume  e) Enthalpy</p>	<i>CO3</i>	<i>PO3</i>	<b>10</b>
<b>OR</b>					
4	a)	State and explain the Amagat's and Dalton's laws.	<i>CO1</i>	<i>PO1</i>	<b>05</b>
	b)	State and explain Henry's law and Raoult's law.	<i>CO1</i>	<i>PO1</i>	<b>05</b>
	c)	<p>Natural gas is piped from the well at 300 K and 400 kPa. The gas is found to contain 93.0% methane, 4.5% ethane and the rest nitrogen. Calculate the following:</p> <p>i. The partial pressure of nitrogen  ii. The pure-component volume of ethane in 10 m<sup>3</sup> of the gas  iii. The density at standard conditions in kg/m<sup>3</sup></p>	<i>CO1</i>	<i>PO1</i>	<b>10</b>
<b>UNIT - III</b>					
5	a)	<p>A drier is fed with wet solid to reduce the moisture content from 80 % to 15 %. The product leaving the drier is admitted into an oven which further brings down the moisture to 2 %. If the drier can handle 1000 kg of wet solid per day, calculate (a) the weight of products leaving the drier and the oven per day (b) the percentage of the original water that is removed in the drier and the oven.</p>	<i>CO2</i>	<i>PO2</i>	<b>10</b>
	b)	<p>An aqueous solution of methanol containing 20% (weight) methanol is to be separated into a distillate product containing 97% (weight) methanol and a bottom product containing 2% (weight) methanol. For treating 100 kg of feed with a reflux ratio of 3.5 on a weight basis, calculate the following: (a) The amount of distillate and bottom products (b) The amount of vapor condensed in the condenser per kg of distillate (c) The amount of vapor condensed in the condenser per kg of feed.</p>	<i>CO2</i>	<i>PO2</i>	<b>10</b>

<b>OR</b>					
6	a)	<p>A triple effect evaporator (as shown in the below Figure) is used to concentrate 1000 kg of aqueous solution from a concentration of 20% solute to 80% solute. Assuming an equal amount of vaporization in each effect, calculate the composition and weight of the solution entering the second and third effects.</p> 	<i>CO2</i>	<i>PO2</i>	<b>10</b>
	b)	<p>The waste acid from a nitrating process contains 30 % <math>\text{H}_2\text{SO}_4</math>, 35 % <math>\text{HNO}_3</math> and 35 % <math>\text{H}_2\text{O}</math> by weight. The acid is to be concentrated to contain 39 % <math>\text{H}_2\text{SO}_4</math> and 42 % <math>\text{HNO}_3</math> by addition of concentrated sulphuric acid containing 98 % <math>\text{H}_2\text{SO}_4</math> and concentrated nitric acid containing 72 % <math>\text{HNO}_3</math> (by weight). Calculate the quantities of three acids to be mixed to get 1000 kg of desired mixed acid.</p>	<i>CO2</i>	<i>PO2</i>	<b>10</b>
		<b>UNIT - IV</b>			
7	a)	<p>A limestone analysis is reported as <math>\text{CaCO}_3 = 92.89\%</math>, <math>\text{MgCO}_3 = 5.41\%</math>, and Insoluble = 1.70%, all percentage by weight.</p> <p>(a) How many kilograms of <math>\text{CaO}</math> can be made from 6 tonnes of this limestone?</p> <p>(b) How many kilograms of <math>\text{CO}_2</math> be recovered per kg of limestone?</p> <p>(c) How many kilograms of limestone are needed to make 2 tonnes of lime?</p>	<i>CO2</i>	<i>PO2</i>	<b>12</b>
	b)	Explain the terms with examples: limiting reactant, conversion, yield, and selectivity.	<i>CO2</i>	<i>PO2</i>	<b>08</b>
		<b>OR</b>			
8	a)	<p>A combustion reactor is fed with 50 kmol/h of butane and 2500 kmol/h of air. Calculate the percentage of excess oxygen and the composition of gases leaving the combustion reactor. Assume complete combustion.</p> <p>Reaction: <math>\text{C}_4\text{H}_{10} + 6.5\text{O}_2 \rightarrow 4\text{CO}_2 + 5\text{H}_2\text{O}</math></p>	<i>CO2</i>	<i>PO2</i>	<b>12</b>
	b)	What are fuel and flue gases? Discuss the following.	<i>CO2</i>	<i>PO2</i>	<b>08</b>
		<p>i.      Ultimate analysis  ii.     Proximate analysis</p>			

UNIT - V																								
	9	a)	Production of single cell proteins from hexadecane is given by the following equation. If the respiratory quotient (RQ) is 0.4, determine the stoichiometric coefficients. $C_{16}H_{34} + aO_2 + bNH_3 \rightarrow cCH_{1.66}O_{0.27}N_{0.2}$ (biomass) + dCO <sub>2</sub> + eH <sub>2</sub> O	CO4	PO2	<b>06</b>																		
		b)	Differentiate between the standard heat of formation and standard heat of combustion.	CO4	PO2	<b>04</b>																		
		c)	Derive a relationship between temperature and heat of reaction for the following reaction. $aA + aB \rightarrow lL + mM$ Given, specific heat, $C_P = \alpha + \beta T + \gamma T^2$ .	CO4	PO2	<b>10</b>																		
			<b>OR</b>																					
	10	a)	Calculate the heat of the reaction at 873 K and 101325 Pa for the following reaction. $CO_2 + 4H_2 \rightarrow CH_4 + 2H_2O$ Given the heat of formation data:	CO4	PO2	<b>12</b>																		
			<table border="1"> <thead> <tr> <th>Component</th> <th><math>\Delta H_f^\circ</math> (kJ/mol)</th> </tr> </thead> <tbody> <tr> <td>CO<sub>2</sub></td> <td>-393.65</td> </tr> <tr> <td>CH<sub>4</sub></td> <td>-241.90</td> </tr> <tr> <td>H<sub>2</sub>O</td> <td>-74.89</td> </tr> </tbody> </table> Given the specific heat data: <table border="1"> <thead> <tr> <th>Component</th> <th><math>C_P</math> (J/mol K)</th> </tr> </thead> <tbody> <tr> <td>CO<sub>2</sub></td> <td><math>26.54 + 42.25 \times 10^{-3}T - 14.29 \times 10^{-6}T^2</math></td> </tr> <tr> <td>H<sub>2</sub></td> <td><math>26.89 + 4.35 \times 10^{-3}T - 0.3265 \times 10^{-6}T^2</math></td> </tr> <tr> <td>CH<sub>4</sub></td> <td><math>13.41 + 77.06 \times 10^{-3}T - 18.76 \times 10^{-6}T^2</math></td> </tr> <tr> <td>H<sub>2</sub>O</td> <td><math>29.18 + 14.50 \times 10^{-3}T - 2.02 \times 10^{-6}T^2</math></td> </tr> </tbody> </table>	Component	$\Delta H_f^\circ$ (kJ/mol)	CO <sub>2</sub>	-393.65	CH <sub>4</sub>	-241.90	H <sub>2</sub> O	-74.89	Component	$C_P$ (J/mol K)	CO <sub>2</sub>	$26.54 + 42.25 \times 10^{-3}T - 14.29 \times 10^{-6}T^2$	H <sub>2</sub>	$26.89 + 4.35 \times 10^{-3}T - 0.3265 \times 10^{-6}T^2$	CH <sub>4</sub>	$13.41 + 77.06 \times 10^{-3}T - 18.76 \times 10^{-6}T^2$	H <sub>2</sub> O	$29.18 + 14.50 \times 10^{-3}T - 2.02 \times 10^{-6}T^2$			
Component	$\Delta H_f^\circ$ (kJ/mol)																							
CO <sub>2</sub>	-393.65																							
CH <sub>4</sub>	-241.90																							
H <sub>2</sub> O	-74.89																							
Component	$C_P$ (J/mol K)																							
CO <sub>2</sub>	$26.54 + 42.25 \times 10^{-3}T - 14.29 \times 10^{-6}T^2$																							
H <sub>2</sub>	$26.89 + 4.35 \times 10^{-3}T - 0.3265 \times 10^{-6}T^2$																							
CH <sub>4</sub>	$13.41 + 77.06 \times 10^{-3}T - 18.76 \times 10^{-6}T^2$																							
H <sub>2</sub> O	$29.18 + 14.50 \times 10^{-3}T - 2.02 \times 10^{-6}T^2$																							
		b)	Explain the terms: heat of formation, heat of reaction, heat of solution, and heat of mixing.	CO4	PO2	<b>08</b>
